

How To Shot Web

(Better hacking in 2015)

bugcrowd

whoami

Jason Haddix

- Bugcrowd
- Director of Technical Ops
- Hacker & Bug hunter
- #1 on all-time leaderboard bugcrowd 2014

@jhaddix

What this talk's about...

**Hack
Stuff
Better
(and practically)**

And...LOTS of memes.... only some are funny

More Specifically

Step 1: Cut a hole in a box... j/k

Step 1: Started with my bug hunting methodology

Step 2: Parsed some of the top bug hunters' research (web/mobile only for now)

Step 3: Create kickass preso

Topics? BB philosophy shifts, discovery techniques, mapping methodology, parameters oft attacked, useful fuzz strings, bypass or filter evasion techniques, new/awesome tooling

Philosophy

Differences from standard testing

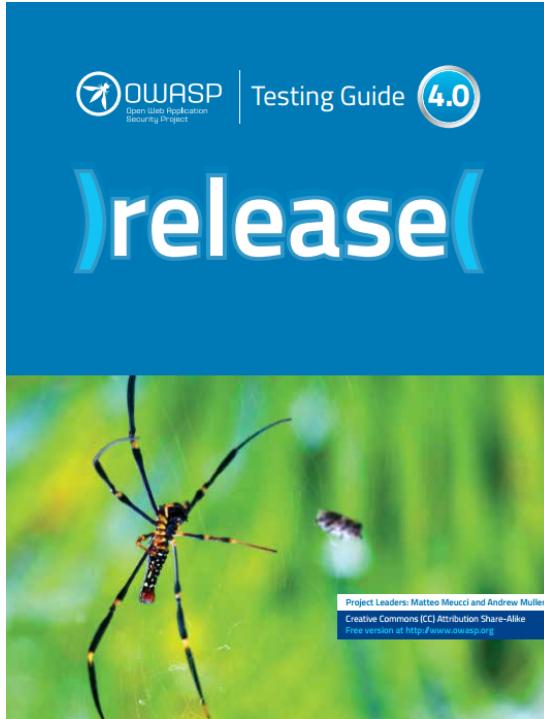

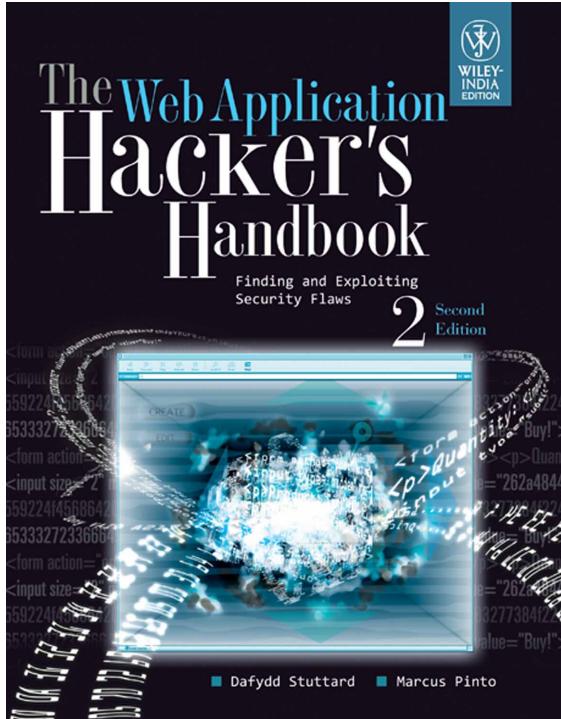

Single-sourced

- looking mostly for common-ish vulns
- not competing with others
- incentivized for count
- payment based on sniff test

Crowdsourced

- looking for vulns that aren't as easy to find
- racing vs. time
- competitive vs. others
- incentivized to find unique bugs
- payment based on impact not number of findings

The regular methodologies

Discovery

Find the road less traveled

^ means find the application (or parts of an application) less tested.

1. *.acme.com scope is your friend
2. Find domains via Google (and others!)
 - a. Can be automated well via recon-
ng and other tools.
3. Port scan for obscure web servers or services (on all domains)
4. Find acquisitions and the bounty acquisition rules
 - a. Google has a 6 month rule
5. Functionality changes or re-designs
6. Mobile websites
7. New mobile app versions

Tool: Recon-ng script (enumall.sh)

```
#!/bin/bash

# Subdomain enumeration script that creates/uses a dynamic resource script for recon-ng.
# only 1 module needs api's (/api/google_site) find instructions for that on the wiki.
# Or you can comment out that module.
# uses google scraping, bing scraping, baidu scraping, netcraft, and bruteforces to find subdomains.
# by @jhaddix

# input from command-line becomes domain to test
```

<https://github.com/jhaddix/domain>

```
root@kali:~/Desktop# ./enumall.sh paypal.com
```

After it's done, a quick "show hosts" in the recon-ng prompt:

```
[recon-ng][paypal.com201401131409][resolve] > show hosts
```

host	ip_address	region	country	latitude	longitude

Port Scanning!

Port scanning is not just for Netpen!

A full port scan of all your new found targets will usually yield #win:

- separate webapps
- extraneous services
- Facebook had Jenkins Script console with no auth
- IIS.net had rdp open vulnerable to MS12_020

```
nmap -sS -A -PN -p- --script=http-title dontscanme.bro
```

^ syn scan, OS + service fingerprint, no ping, all ports,
http titles

How I hacked Facebook

Ok, ok. I didn't quite "hack Facebook". What I did was execute OS level commands on one of Facebook's acquisition's servers.

This is how I did it.

One day last September I was in bed with terrible flu. While I was bedridden I got bored and started to poke around Facebook's Bug Bounty program. I have participated in Bug Bounties before but never Facebook's.

This is by no means a complicated hack by the way, but it worked.

I started by port scanning Facebook's in scope domains with Nmap. Probed a few listening services on IPs that looked interesting.

Mapping

Mapping tips

- Google
 - *Smart* Directory Brute Forcing
 - [RAFT lists](#) (included in [Seclists](#))
 - [SVN Digger](#) (included in [Seclists](#))
 - [Git Digger](#)
 - Platform Identification:
 - [Wapplyzer](#) (Chrome)
 - [Builtwith](#) (Chrome)
 - [retire.js](#) (cmd-line or Burp)
 - Check CVE's
 - Auxiliary
 - [WPScan](#)
 - [CMSmap](#)

Directory Bruteforce Workflow

After bruteforcing look for other status codes indicating you are denied or require auth then append list there to test for misconfigured access control.

Example:

GET http://www.acme.com - 200

GET http://www.acme.com/backlog/ - 404

GET http://www.acme.com/controlpanel/ - 401 hmm.. ok

GET http://www.acme.com/controlpanel/ [bruteforce here now]

Mapping/Vuln Discovery using OSINT

Find previous/existing problem:

- Xssed.com
- Reddit XSS - /r/xss
- Punkspider
- xss.cx
- xssposed.org
- twitter searching
- ++

Issues might already reported but use the flaw area and injection type to guide you to further injections or filter bypass.

New Project: Maps

New OSINT/Mapping project

- 250+ bounty programs
 - Crawl
 - DNS info + bruteforce
 - Bounty metadata (links, rewards, scope)
 - API -> Intrigue

<http://github.com/bugcrowdlabs/maps>

Auth and Session

Auth (better be quick)

Auth Related (more in logic, priv, and transport sections)

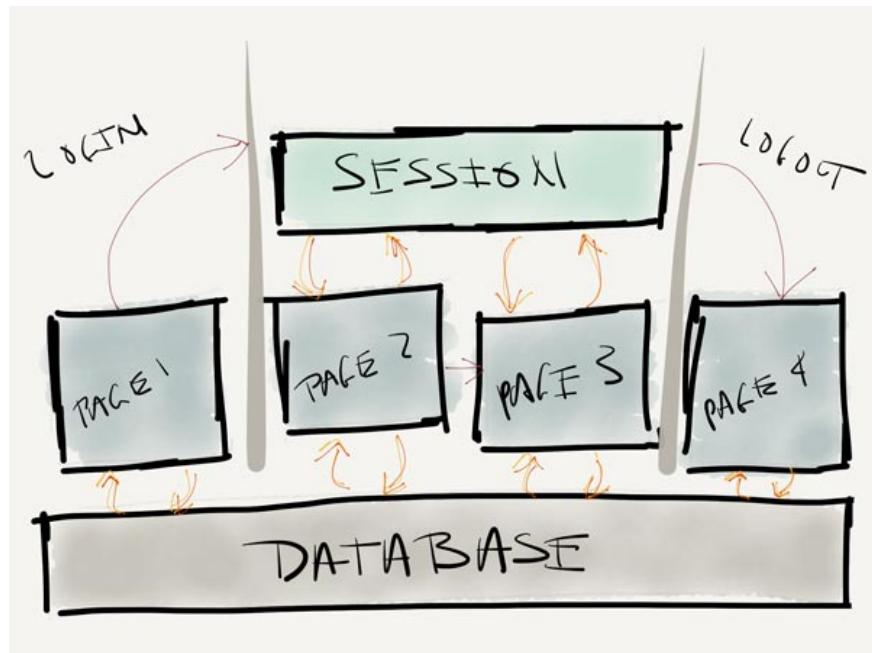

- User/pass discrepancy flaw
- Registration page harvesting
- Login page harvesting
- Password reset page harvesting
- No account lockout
- Weak password policy
- Password not required for account updates
- Password reset tokens (no expiry or re-use)

Session (better be quick)

Session Related

- Failure to invalidate old cookies
- No new cookies on login/logout/timeout
- Never ending cookie length
- Multiple sessions allowed
- Easily reversible cookie (base64 most often)

Tactical Fuzzing - XSS

XSS

Core Idea: Does the page functionality display something to the users?

For time sensitive testing the 80/20 rule applies. Many testers use **Polyglot** payloads. You probably have too!

XSS

Multi-context, filter bypass based polyglot payload #1 ([Rsnake XSS Cheat Sheet](#))

XSS

```
"">>><marquee><img src=x onerror=confirm(1)></marquee>
></plaintext><|><plaintext/onmouseover=prompt(1)
><script>prompt(1)</script>@gmail.com<isindex
formaction=javascript:alert(/XSS/) type=submit>'-->
></script><script>alert(1)</script>">
```

Multi-context, filter bypass based polyglot payload #2 (Ashar Javed [XSS Research](#))

XSS

“ onclick=alert(1)//<button ‘ onclick=alert(1)//> */ alert(1)//

Multi-context polyglot payload ([Mathias Karlsson](#))

Other XSS Observations

Input Vectors

Customizable Themes & Profiles via CSS

Event or meeting names

URI based

Imported from a 3rd party (think Facebook integration)

JSON POST Values (check returning content type)

File Upload names

Uploaded files (swf, HTML, ++)

Custom Error pages

fake params - ?realparam=1&foo=bar'+alert(/XSS/)+'

Login and Forgot password forms

SWF Parameter XSS

Common Params:

Common Params:

onload, allowedDomain, movieplayer, xmlPath, eventhandler, callback (more on OWASP page)

Common Injection Strings:

\%22}}}))}catch(e){alert(document.domain);}//

"]);}catch(e){if(!self.a)self.a=!alert(document.domain);}//

"a")({{type:"ready"}});}catch(e){alert(1)}//

SWF Parameter XSS

Hello, world!

Welcome to project "Flashbang". This tool is an open-source Flash-security helper with a very specific purpose: Find the flashVars of a naked SWF and display them so a security tester can start hacking away without decompiling the code. For fun, try [this](#) vulnerable old version of swfupload in flashbang

Tactical Fuzzing - SQLi

SQL Injection

Core Idea: Does the page look like it might need to call on stored data?

There exist some SQLi polyglots, i.e;

SLEEP(1) /*' or SLEEP(1) or "" or SLEEP(1) or "*'

Works in single quote context, works in double quote context, works in “straight into query” context! ([Mathias Karlsson](#))

SQL Injection

You can also leverage the large database of fuzzlists from [Seclists](#) here:

 danielmiessler / [SecLists](#)

 branch: master [▼](#) [SecLists](#) / [Fuzzing](#) / [+](#)

Update JHADDIX_LFI.txt

 [shipcod3](#) authored on Jan 26

..

[FUZZDB_GenericBlind.txt](#)

[FUZZDB_MSSQL.txt](#)

[FUZZDB_MSSQLEnumeration.txt](#)

[FUZZDB_MYSQL.txt](#)

[FUZZDB_Metacharacters.txt](#)

[FUZZDB_SQLReadLocalFiles.txt](#)

[FUZZDB_SQL_SQLi_LoginBypass.txt](#)

[FUZZDB_Oracle.txt](#)

[FUZZDB_PostgresEnumeration.txt](#)

SQL Injection Observations

Blind is predominant, Error based is highly unlikely.

```
'%2Bbenchmark(3200,SHA1(1))%2B'  
'+BENCHMARK(40000000,SHA1(1337))+'
```

SQLMap is king!

- Use -l to parse a Burp log file.
- Use [Tamper Scripts](#) for blacklists.
- [SQLiPy](#) Burp plugin works well to instrument SQLmap quickly.

Lots of injection in web services!

<u>Common Parameters or Injection points</u>

SQLMap Scan Finding

Advisory Request Response

SQLMap Scan Finding

Issue: SQLMap Scan Finding
Severity: High
Confidence: Certain
Host: https://192.168.111.30
Path: /sqlip.php

Issue detail

The application has been found to be vulnerable to SQL injection by SQLMap. The following SQL injection payloads were found:

- id='1' AND 3472=3472 AND 'kzcR'='kzcR'
- id='1' UNION ALL SELECT NULL,NULL,NULL,CONCAT(0x716b676e71,
- id='1' AND SLEEP([SLEEPTIME]) AND 'Acmt'=Acmt

Enumerated Data:

MySQL: 5.5.39
Current User: root@localhost
Current Database: fake
Hostname: hacktab
Is a DBA: Yes
Users:

- 'fake'@'127.0.0.1'

Malicious File Upload ++

This is an important and common attack vector in this type of testing

A file upload functions need a lot of protections to be adequately secure.

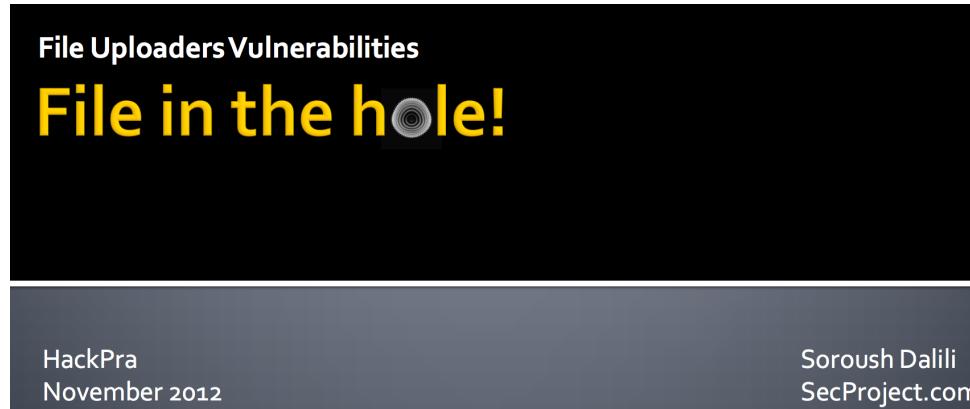

Attacks:

- Upload unexpected file format to achieve code exec (swf, html, php, php3, aspx, ++) Web shells or...
- Execute XSS via same types of files. Images as well!
- Attack the parser to DoS the site or XSS via storing payloads in metadata or file header
- Bypass security zones and store malware on target site via file polyglots

Malicious File Upload ++

File upload attacks are a whole presentation. Try this one to get a feel for bypass techniques:

- content type spoofing
- extension trickery
- File in the hole! presentation - <http://goo.gl/VCXPh6>

Malicious File Upload ++

As referenced file polyglots can be used to store malware on servers!

See @dan_crowley 's talk: <http://goo.gl/pquXC2>

and @angealbertini research: corkami.com

CSRF

Many sites will have CSRF protection, focus on CSRF **bypass**!

Common bypasses:

- Remove CSRF token from request
- Remove CSRF token parameter value
- Add bad control chars to CSRF parameter value
- Use a second identical CSRF param
- Change POST to GET

Check this out...

CSRF

Debasish Mandal wrote a python tool to automate finding CSRF bypasses called [Burpy](#).

Step 1: Enable logging in Burp. Crawl a site with Burp completely executing all functions.

Step 2: Create a template...

debasishm89 on Oct 30, 2013 Update samplexsrf.py

Privilege, Transport, Logic

Privilege

Often logic, priv, auth bugs are blurred.

Testing user priv:

1. admin has power
2. peon has none
3. peon can use function only meant for admin

Privilege

1. Find site functionality that is restricted to certain user types
2. Try accessing those functions with lesser/other user roles
3. Try to directly browse to views with sensitive information as a lesser priv user

Autorize Burp plugin is pretty neat here...

<https://github.com/Quitten/Autorize>

Common Functions or Views

Add user function

Delete user function

start project / campaign / etc function

change account info (pass, CC, etc) function

customer analytics view

payment processing view

any view with PII

1. Browse using high priv user
2. Login with a lower priv user
3. Burp Plugin re-requests to see if low priv can access high priv

P Select an App

Account

Overview Billing App keys Notifications

Parse Store \$ 109.7

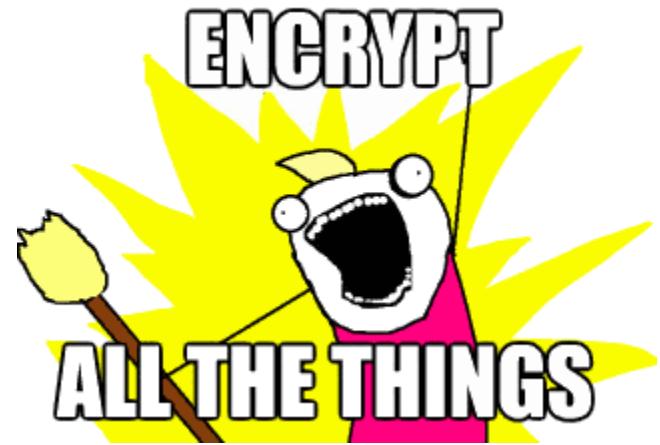

Request Limit (30 req/s)

Transport

Most security concerned sites will enable HTTPs. It's your job to ensure they've done it **EVERWHERE**. Most of the time they miss something.

Examples:

- Sensitive images transported over HTTP
- Analytics with session data / PII leaked over HTTP

Transport

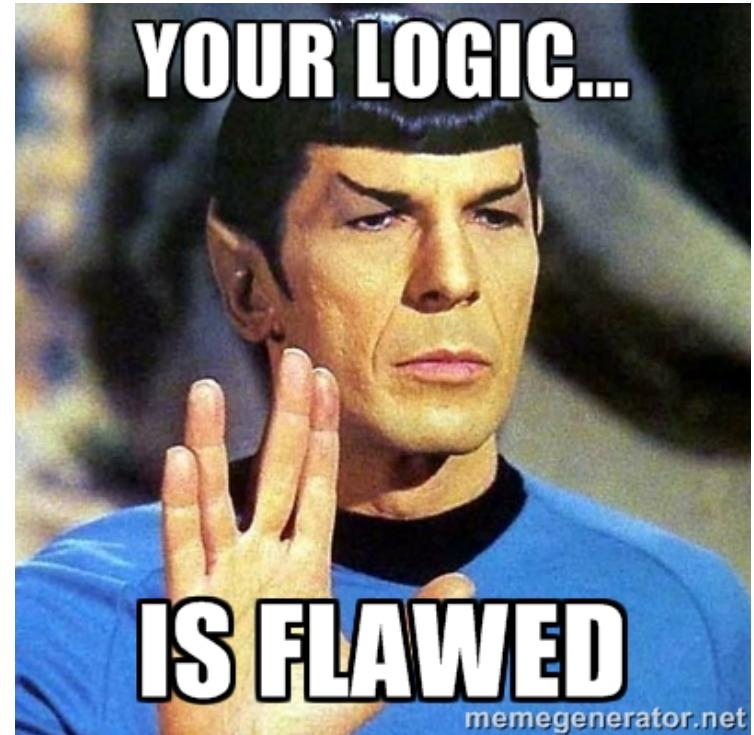

<https://github.com/arvinddoraiswamy/mywebappscripts/tree/master/ForceSSL>

1. Spider the application **and** generate a site **map** in Burp.
2. Select the sites/directories that you want using CTRL+Click; right click in Burp **and select 'Copy all URLs'**.
3. Create a new file called `https_urls` in the same directory **as** this script.
4. Paste the copied URLs into this file **and** save this file.
5. Run the script `force_http_req_threaded.py` **as** follows - `python force_http_req_threaded.py`.
6. Create a directory called `URLs`. The file '`https_urls`' is copied into `URLs` **and split** into multiple files; **each** having 200 lines.
7. Each file is processed **and** every single https URL now requested over HTTP.
8. The result of this process is written into a file called '`report`'. This file is in the same directory **as** the script.

Logic

Logic flaws that are tricky, mostly manual:

- substituting hashed parameters
- step manipulation
- use negatives in quantities
- authentication bypass
- application level Dos
- Timing attacks

Mobile

Data Storage

It's common to see mobile apps not applying encryption to the files that store PII.

Common places to find PII unencrypted

Phone system logs (avail to all apps)

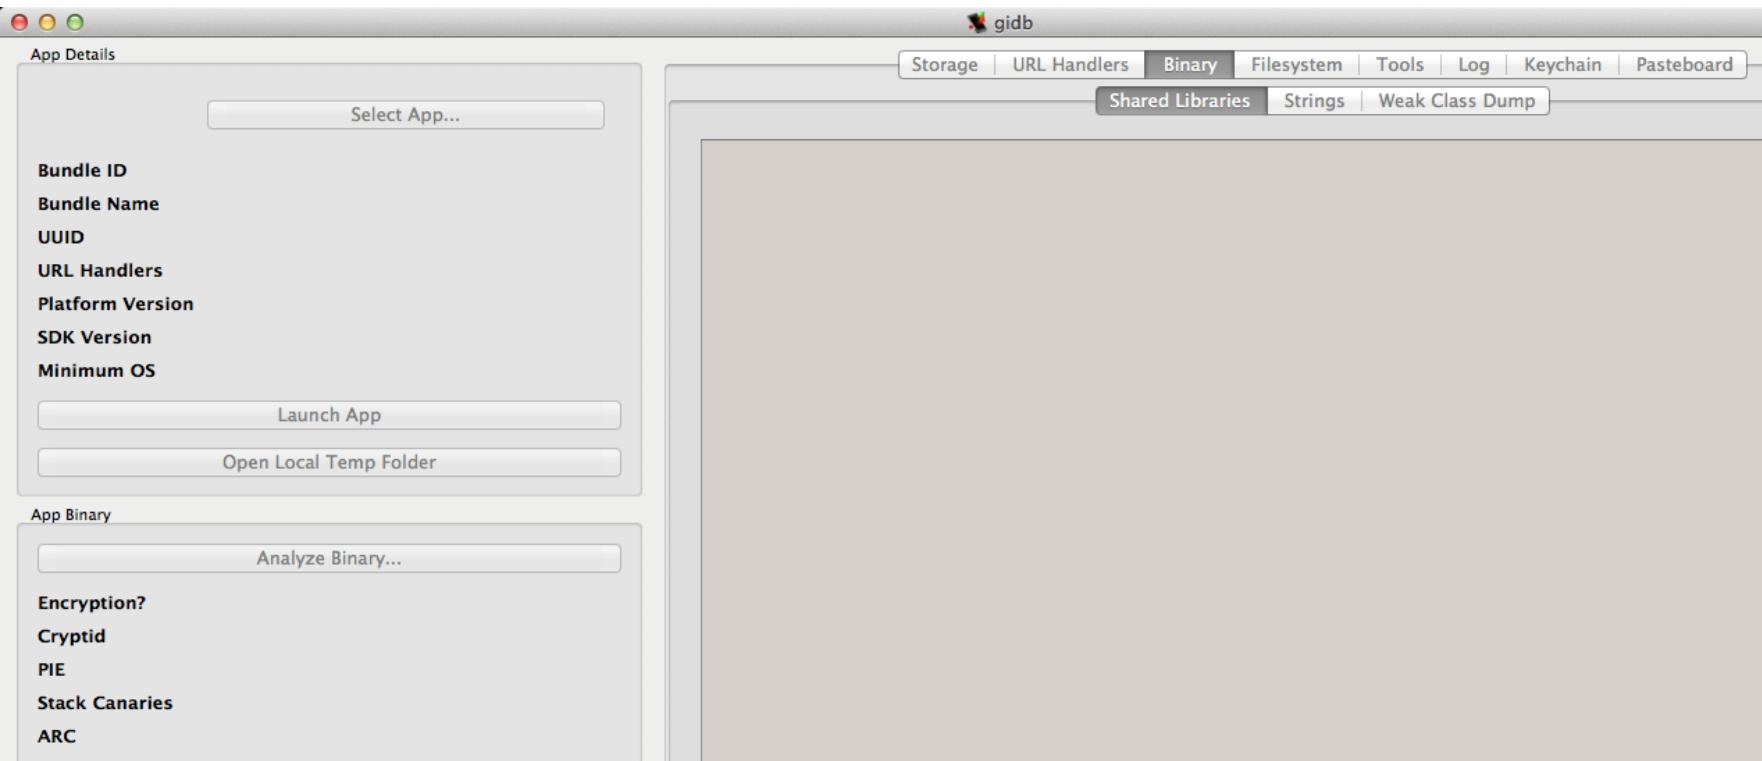

webkit cache (cache.db)

plists, dbs, etc

hardcoded in the binary

Quick spin-up for iOS

Daniel Mayers [idb tool](#):

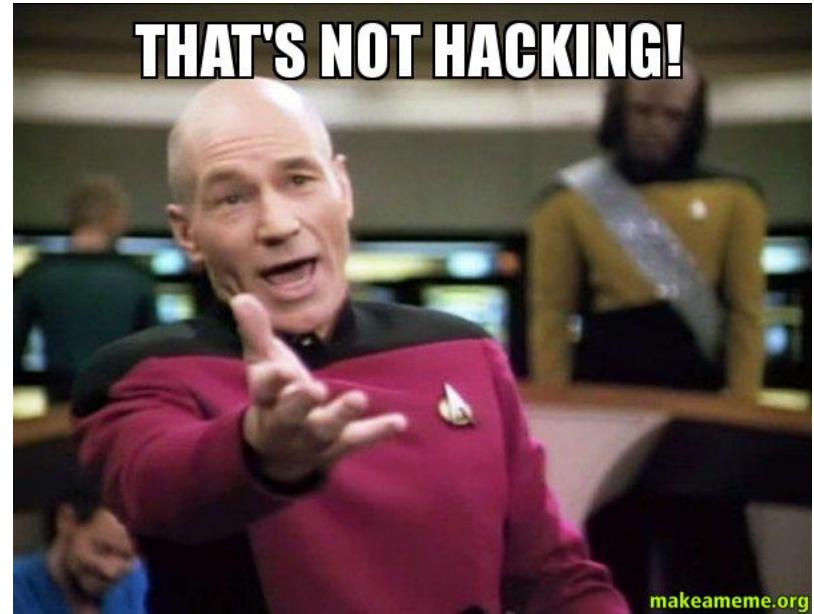

Logs!

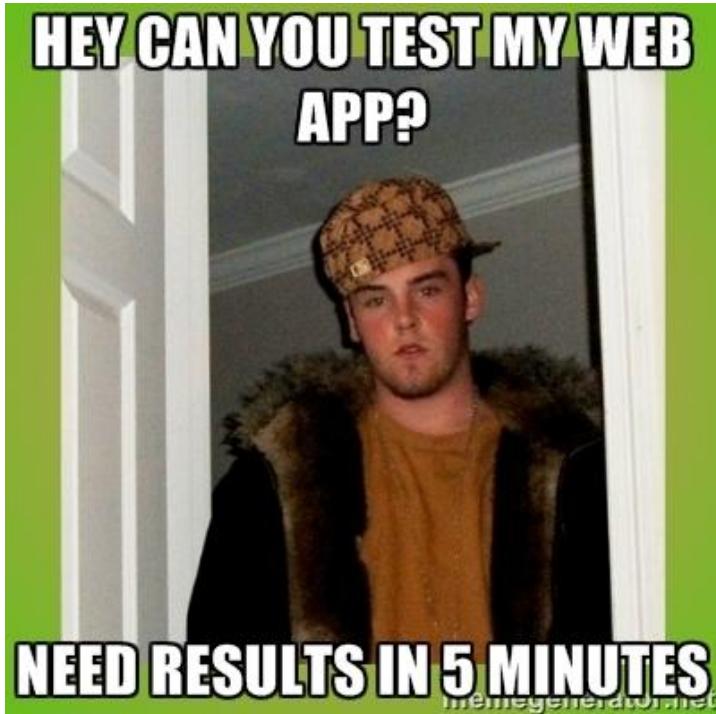

Auxiliary

The vulns formerly known as “noise”

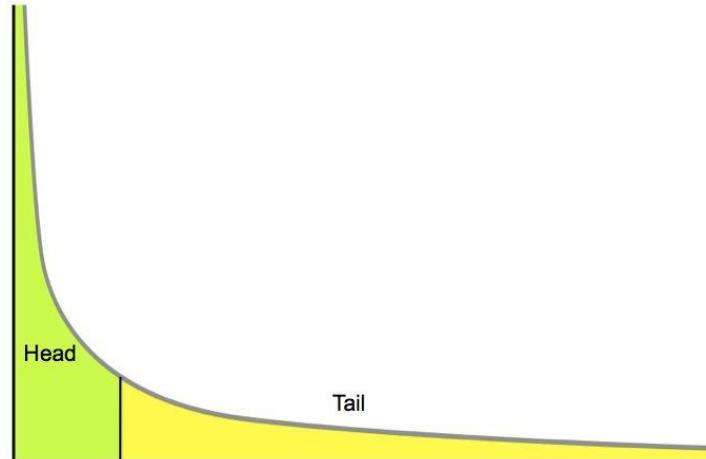

- Content Spoofing or HTML injection
- Referer leakage
- security headers
- path disclosure
- clickjacking
- ++

How to test a web app in n minutes

How can you get maximum results within a given time window?

Data Driven Assessment (diminishing return FTW)

1. Visit the search, registration, contact, password reset, and comment forms and hit them with your polyglot strings
2. Scan those specific functions with Burp's built-in scanner
3. Check your cookie, log out, check cookie, log in, check cookie. Submit old cookie, see if access.
4. Perform user enumeration checks on login, registration, and password reset.
5. Do a reset and see if; the password comes plaintext, uses a URL based token, is predictable, can be used multiple times, or logs you in automatically
6. Find numeric account identifiers anywhere in URLs and rotate them for context change
7. Find the security-sensitive function(s) or files and see if vulnerable to non-auth browsing (idors), lower-auth browsing, CSRF, CSRF protection bypass, and see if they can be done over HTTP.
8. Directory brute for top short list on SecLists
9. Check upload functions for alternate file types that can execute code (xss or php/etc/etc)

~ 15 minutes

Things to take with you...

1. Crowdsourced testing is different enough to pay attention to
2. Crowdsourcing focuses on the 20% because the 80% goes quick
3. Data analysis can yield the most successfully attacked areas
4. A 15 minute web test, done right, could yield a majority of your critical vulns
5. Add polyglots to your toolbelt
6. Use SecLists to power your scanners
7. Remember to periodically refresh your game with the wisdom of other techniques and other approaches

Follow these ninjas who I profiled: <https://twitter.com/Jhaddix/lists/bnijnas>

Gitbook project: The Bug Hunters Methodology

This preso ended up to be way too much to fit in an 45min talk so... we turned it into a Git project! (if you are reading this from the Defcon DVD check my [twitter](#) or [Github](#) for linkage)

- 50% of research still unparsed
- More tooling to automate
- XXE and parser attacks
- SSRF
- Captcha bypass
- Detailed logic flaws
- More mobile
